Dear reader,

Currently, the *status quo* of scientific dissemination in international journals has been intensifying and changing significantly. Until a certain time ago, research, and consequently, scientific publications, especially in the field of business and organizations, were developed to meet the conditions and predispositions of internal environments and markets. As time has passed, research continues to focus on internal scenarios, given various constraints. However, publications have already been largely directed towards international journals and audiences.

In this context, some journals are already directing their publications towards the scope of international contributions. This strategic initiative assumes singular importance. First, it brings researchers from various countries into contact, contributing to the integration and sharing of research, evolving in approaches to epistemologies, theories, morphologies, methodologies, technologies, and metrics of researched and researchable content. In addition to these conditions, the promotion of research on frontier topics is encouraged, allowing for the development of comparative analyses on content and methods that effectively lead to the advancement of knowledge.

It is also important to highlight the significant condition of the democratization of knowledge and its dissemination through the exchange of experiences among researchers from diverse countries. Thus, although it is extremely important to consider the relevance of scientific production from developed countries and traditional knowledge generators, the conveniences of paying attention to and addressing the emerging contributions provided by research developed in scientifically emerging countries are increasingly significant.

Fortunately, the world is diverse in every sense.

Science, technology, and innovation must understand and cater to all the diversities coming from all regions of the world. After all, around the world, there are organizations and

individuals with initiatives in the production of something, whose experiences can and should be showcased in other regions.

In this context of a world open to new disclosures, scientific journals must be willing and able to meet the new circumstances of life, management, and organizations, which are increasingly dispersed and ever-changing.

It is in this complex, sophisticated, and intelligent world of scientific and technological dissemination that the Journal Management & Technology is situated and positioned. In this Special Edition, we present twelve invited and pre-reviewed articles, from authors from five countries, mainly from the Eastern world. For this editorial, it is an honor to be the preferred choice of foreign authors, so they can showcase their contributions to the advancement of knowledge.

Reaffirming its purposes, the Journal Management & Technology, through this Editorial, expresses its satisfaction and honor in presenting these contributions to the scientific communities. It offers, in accordance with the state of the art in this field, substantial, robust, consistent, important, and timely content, provided by researchers, aiming to contribute to the evolution of knowledge in critical foundations of management science. These are articles that effectively challenge the status quo of each frontier addressed, in the dimensions of theories and methodologies. We thank the authors who believed in the purposes of this journal, submitting their articles in accordance with the criteria and publication processes. Awaiting contributions in the form of article submissions, serious evaluations consistent with the purposes of this journal, recommendations of it to your students and friends, as well as constructive criticisms, I renew my wishes for good reading and great reflections.

Keywords: Scientific production. Scientific internationalization. Scientific dissemination. International research
